Ryan Charek, Rough Brothers Greenhouses

Monty Holmes, Smithsonian Gardens

Margie Radebaugh, Phipps Conservatory and Botanical Gardens

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Why build new support facilities?

- Undersized growing space related to increased display gardens
 - Improve proper plant culture and overall quality of plants grown ==SPACE!
- Increased programming and initiatives
 - Community and urban programs, education, summer camps, etc., etc.
 - Need for growing organically, and quarantine areas
- Aging buildings and facilities
 - Cost of yearly maintenance and repairs increasing
- New plant collections, increased need from science and research
 - i.e. Orchids, Bonsai collection increase, Southern Hemisphere bulb collection, plant evaluations, plant breeding, climate change studies, etc.
- New displays, exhibits or shows
 - CBG > Orchid Show, increase winter bloom for conservatories
 - More “Wow” displays and plants

CHANGING PERSPECTIVES: PLANTING FOR THE FUTURE

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

CHANGING PERSPECTIVES: PLANTING FOR THE FUTURE

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Getting started with the plan...

- Create the idea and demonstrate the need for new facilities
- Develop the “program” for the new space
- Figure out how is it going to be paid for
 - 10 year \$125M Capital Campaign- *“Keep Growing”*

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

CHANGING PERSPECTIVES: PLANTING FOR THE FUTURE

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Propagation & staff support areas

- As needs and staff numbers increased, additional structures would be erected.
- Staff support areas would become filled and/or expand to other areas – aka “the creep factor”.

Space limitations

- Growing collection has maximized existing facilities.
- Reduction in air circulation between plants if pots too close together.
- Up-potting of plants limited by available space.

Environmental Condition Limitations

- Evaporative cooling wall and heating system were state of the art at the time.
- Inability to provide optimal conditions for collection variety.
- Surviving not thriving.

Library plaza and East Courtyard:

The Library is the anchor for the east campus; it is the gateway to the new east courtyard and is a link—both in terms of location and program function—between the existing core campus and the new east campus. The space between the library and succulent house currently features a shaded seating spot among the agaves and aloes; this would be expanded to accommodate small events.

A 3,650 square foot expansion off the east side of Pulliam would house additional lab and office space for research and serve as an additional link between the office and support spaces and the buildings that form the new east campus. The Pulliam Center, with its rich mix of departmental users would become a literal and metaphorical hinge between the old and new campuses.

Building on the successful hybrid use of Boppard Courtyard, the East Courtyard will be an 8,400 square foot plaza space surrounded by five buildings jointly used by Research, Horticulture, Education and Administration. As with the Dorrance Hall, an educational lab building and greenhouse/ exhibit space will draw visitors into the East Courtyard and demonstrate how the varied strands of the DBG mission come together. Located at the edge of the east exhibit trail, the 5,350 square foot educational lab building can host a variety of activities including classes, hands-on activities or overnight adventures. In addition, these spaces can potentially serve a year-round function.

CHANGING PERSPECTIVES: PLANTING FOR THE FUTURE

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Greenhouse 2

Donated to **Borderlands Restoration** to be repurposed as a growing area to propagate native plants which are used in habitat restoration projects in National Parks, BLM lands and several projects including pollinators, monarch butterflies, etc.

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Cactus Shade House

- Plant benches were “hooped” to protect the plants while the structure was dismantled around them and relocated.
- The structure footprint went from 40' x 100' to 50' x 80'.
- Same square footage (4000 sq/ft) but the new arrangement of tables provides room for more plants.

Butterfly Pavilion

- Metal frame was recycled.
- Metal posts from walkway canopy will be repurposed into a trellis or shade canopy.
- Plants were salvaged to be used elsewhere in the garden.
- Don't forget the fish!

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Fleischer Propagation Building

Frame and exterior shell to be repurposed as a desert home for a client from Switzerland.

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Master Planning the Glass 'Houses' –
Production and Display

Scott C. Scarfone, ASLA
sscarfone@oasisdesigngroup.com

Efficient greenhouse and display conservatories must consider the botanical **'spatial supply chain'** which feeds the system.

Storage and production spaces within conservatories and greenhouses should be designed to consider display and flexible spaces required for a pre-established set of objectives.

Conservatory Display Types

Permanent Collections

The majority of a conservatory's display, permanent collections need to be grown/replaced constantly to ensure visual consistency and plant health.

Mass 'filler'

Mass plantings, or 'filler,' is the glue that holds different collections and displays together and creates continuity between displays. Specific filler content can fluctuate through the seasons.

Seasonal Displays

Seasonal displays require a variety of growing conditions and spaces, but provide the diversity of experience necessary to attract return visitors.

Greenhouse growing types/categories

- **Holding / Quarantine Areas**
 - Holds crops received from outside vendors until certain they are disease/infestation free
- **Vendor Receiving / Storage**
 - Stores crops grown by outside vendors for specialized temporary shows
- **Seasonal Crops**
 - The largest growing space raises plants for seasonal shows
- **Scientific Collections**
 - Holds any scientific or research oriented plant collections
- **Special Display Collections**
 - Significant grow space (often 2:1) for special collections (orchids, bonsai, etc.)
- **Permanent Collections**
 - Limited space for replacing or expanding permanent display plants

Designing for Overlap

- Production Overlap**
 - Different plant communities require different gestation and growth times, so different seasons might require different spatial needs
- Storage overlap**
 - As productions needs fluctuate, space can be delegated to storage or receiving space for vendor grown plants
- Vendor Support**
 - The quantity of plant material for seasonal displays purchased from vendors can also vary based on the current production need of the Conservatory

Overlapping Production Times

Emphasis on Production

Emphasis on Display

2. New Welcome/Event Center
3. Production Areas
4. **Related Gardens**
 - a. Guest Entry
 - b. Café Garden/Terrace
 - c. Courtyard Gardens
 - d. Main Gardens

Designing for Flexibility

- Changing seasonal shows, themed events, and venues are tools to attract return visitors and investors.
- The ability to convert display space to venue / event space creates these opportunities while keeping the spatial supply chain flexible

Desired changes:

- More varied seasonal displays
- Less rigid program
- Fix lack of flexible spaces

TOTAL PERMANENT SPACE
 6,643 SF

Building the Future of Public Gardens Under Glass

Planning and Programming
Design to Construction

-Ryan Charek, Rough Brothers

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Planning and Programing – Design Phase

How Planning Helps Us Help You

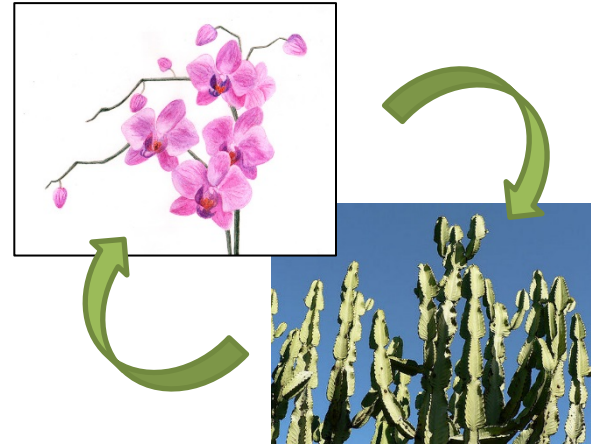

- Expectations, pluses, minuses, optimization & Design/Flexibility
 - Spatial Relationships (free standing, abutting, height, cross flow, etc...)
 - Zone Sizing
 - Conservatory Equipment Considerations & Selections (effective lengths, cooling/heating capacities, energy efficiency, etc...)
 - Location, Location, Location (at grade, roof top, accessibility (moving of plants and maintenance), shadows, etc...)

Planning and Programing – Design Phase

How Programming Helps Us Help You

- Set Climate Expectations (equipment selection, glazing types, etc...)
 - Targeted Plant Needs
 - Conservatory Equipment Needs
 - Structure/Glazing Needs
 - Sustainable Materials/Design Needs
- Add equipment not thought of
- Built in Flexibility for a World Class Plant Exhibit

Planning and Programing – Design Phase

Complete Design for Manufacturing & Construction

- Well defined project
 - Sets Precedence of Quality & Performance
 - Generate Project Specific Specifications and Drawings
 - Identifying Optimal Start and Stop Points Between Disciplines and Trades
 - Help Eliminate Scope Gaps and Overlaps
- Design Accountability
 - Set Expectations
 - Everyone is on the Same Page Through Close Coordination with Garden's Team
 - Realistic Budget Costing and Value Engineering

Planning and Programing – Manufacturing & Construction Phase

How do we make sure what is built is to spec/design?... It All Starts with Quality Submittals

- Complete, Detailed and Project Specific
 - Proper Engineering Stamps
 - Complete Conservatory Equipment Submittals
 - Project Specific Plans
- Strong Design Team to Hold Feet to the Fire!

Planning and Programming – Manufacturing & Construction Phase

Installation Inclusion

- Regular, Experienced and Warranted Installation Crews
 - Eliminate Materials Only Nightmares
 - No Separation Between Manufacturer and installation crew
 - Unloading, Sequencing and Proper Storage
 - Complete Installation
 - Setting limits, adjusting shade drives, etc.

Planning and Programing – Manufacturing & Construction Phase

Project Management

- Site Visits By The Conservatory Manufacturer
 - Accountability for the build
 - Observation of safety procedures
 - Start up and owner training with Vendor Participation

CHANGING PERSPECTIVES: PLANTING FOR THE FUTURE

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Orchidefirum

In the 19th century, wealthy Europeans and North Americans went wild for orchids. They filled their greenhouses with species extracted from habitats worldwide, as well as newly "engineered" hybrids.

The tropical orchids that collectors brought to Europe and North America needed the natural environmental conditions of their native habitats: some required heat and moisture, others cool breezes. In cold brown, developed climates, growers had to shelter their expanding collections.

Phipps' Mission

- To inspire and educate all with the beauty and importance of plants; to advance sustainability and promote human and environmental well-being through action and research; and to celebrate its historic glasshouse.

Phipps Tropical Forest and Production Greenhouses

- What features in the Tropical Forest Conservatory and production greenhouses make them more energy efficient and LEED certified?
- What might have been designed differently?
- Future plans?

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

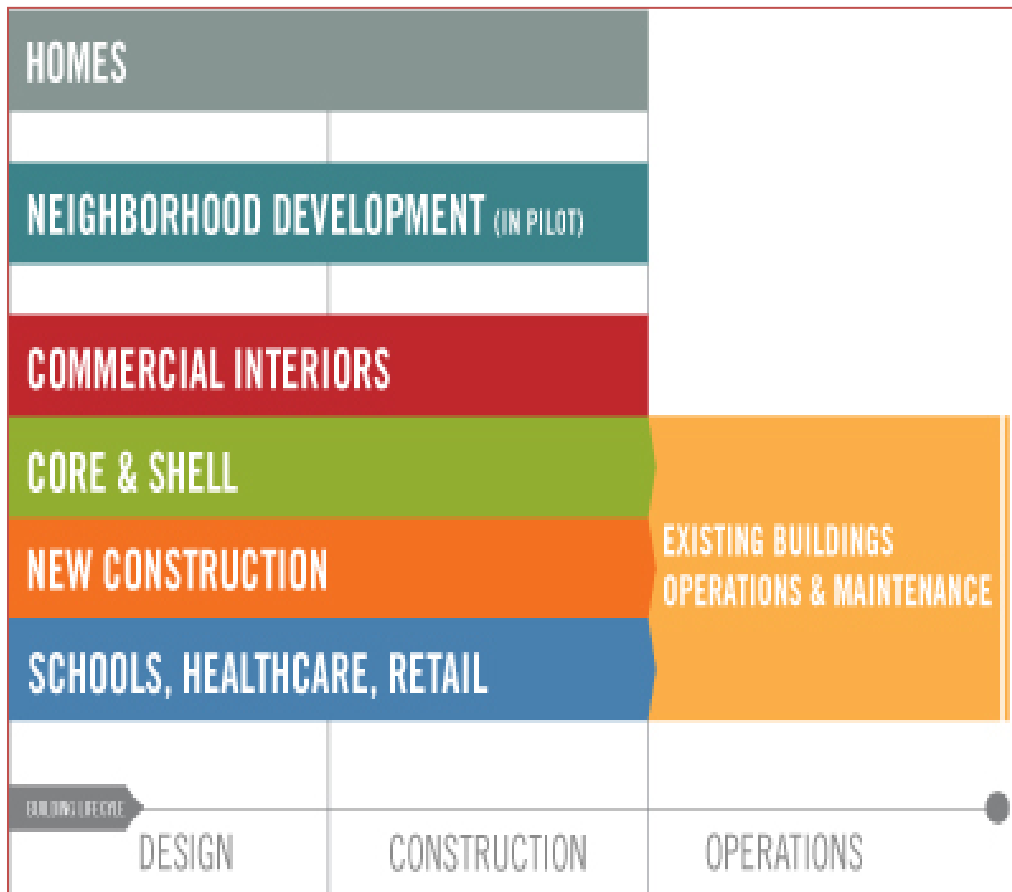

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Eight greenhouse ranges are divided into 16 different growing spaces with individual settings and controls.

Greenhouse space used primarily for growing crops for seasonal exhibits

Growing edibles year round

Much greenhouse space has become multiple use, based on needs of plants, rotating shows and limited space

Store shrubs for winter show with large hardy bonsai

Since we are growing for multiple shows at the same time, rotate plants to make best use of grow lights during shorter days.

Orchid Collection

Energy Efficient Elements

Open roof system. Allows for passive cooling, eliminating use of cooling pads.

Radiant floor heating provides 80% of heat needed in winter.

Energy curtains minimize the space needing heat at night.

Greenhouse control system is run by Argus – opening and closing vents and shade cloth as needed for specific growing space requirements.

Supplemental lighting is
provided by HID lights
controlled by a timer and light
sensitivity

- Rainwater is collected from greenhouse roofs
- Currently trialing a solar distillation system to convert sanitary water from our living building to water that matches the quality of RO.

What we might have done differently...

- Provide more nursery space.
- Quarantine area – great idea but the size does not meet our needs
- Topiary growing area – repurposed for lower light/higher humidity plants such as ferns

What we might have done differently...

- Develop a plan to capture water from the roof during design phase, including a collection point.
- Would like to be able to capture and reuse water from benches.

- Collapsible
mum benches
- Wi-Fi access in
greenhouses

- Quality of rack & pinion
- Do a thorough commissioning with engineers who designed the system and horticulturists who will use the system and look at performance of system and programming of control set points.
- Plan for yearly review of systems and controls.

- Think of accessibility to greenhouses
 - Weight bearing floors for heavier equipment vs. radiant floor heat
 - Placement of hoses and how they work with moving carts through
 - Spacing of aisles between moving benches

- Texturize floors to prevent them becoming slippery.
- Plan for adequate electrical current to support grow lights, planning for future as well as current need.

In the immediate future...

Growing edibles in greenhouse

- In soil
 - Leafy greens
 - Ginger
- Hydroponic
 - Greens
 - Herbs
 - Tomatoes

Energy Saving Strategies

- Unconventional, north-sloping roof design allows for insulated double-pane roof glass, while maintaining proper light levels for growing plants.
- Inspired by open-roof greenhouse technology, half of the 12,000 sf roof opens, eliminating the “greenhouse effect” in this space.

- Energy curtains provide shade in the summer, as well as preventing radiant and convective heat loss in the winter.

- Earth tubes provide passive cooling in the warmer months.
 - Buried 15' below grade where the ground is a constant 55° F year round, cooling hot air as it travels through to the Conservatory.
 - A vacuum is created by hot air exiting the roof vents pulling the cooled air through the Conservatory.

Foot-thick concrete wall insulated on the outside.
Radiant floor heat results in minimal fin tube heating system.

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

Green roof over the support facilities helps to insulate the building, reduce storm water runoff and provide more space to grow plants.

CHANGING PERSPECTIVES: **PLANTING FOR THE FUTURE**

2016 AMERICAN PUBLIC GARDENS ASSOCIATION ANNUAL CONFERENCE

- Storm water from glass roof was kept separate from the gray and black water from the building so it could tie in with a cistern.
- Water in the water features is recycled through the features.

What we might have done differently...

- Water recycling
- Capturing rainwater off of roof
- More effective waterproofing of water features
- Separate pond area water so water could be heated for tropical fish.
- Plan for accessing high points of the structure

Integrative Design Process
